Research Statement

My research centers on **algorithm–infrastructure co-design** for LLMs and agents. I started with **Infra4AI**: optimizing inference infrastructure through serving systems, model–infra co-design, sparse attention, and position-independent caching (e.g., EPIC, DeepServe, RedKnot, Hy4, MiMo-V2). Then, as agents grew more powerful, I began building agent harnesses and memory systems (e.g., PenguinHarness, Akashic). Later, as AI grew more capable, building infrastructure by hand is no longer enough: rather than compete with AI, I train AI to build better infrastructure (**AI4Infra**). I now work on **RSI for harness**: training models to absorb harness capabilities such as compaction, skills, and self-evolution, and to write and evolve harnesses themselves (e.g., GDPevo, Awesome-RSI). Next, I plan to extend AI4Infra to inference infrastructure and even training infrastructure.
